(54) Title: COMPOUNDS

(57) Abstract: Compounds of formula (I) where R<sub>2</sub>, each X, L, Y, Cy, Lp, D and n are as defined in the specification, are serine protease (especially tryptase) inhibitors useful as antiinflammatory agents.

-1-

Compounds

This invention relates to compounds which are inhibitors of serine proteases and to pharmaceutical compositions thereof and their use in the treatment of the human or animal body. More particularly it relates to compounds for use in the treatment of mast cell mediated diseases such as asthma and other allergic and inflammatory conditions and to pharmaceutical compositions thereof and their use in the treatment of the human or animal body, and in particular to compounds which are tryptase inhibitors.

The serine proteases are a group of proteolytic enzymes which have a common catalytic mechanism characterized by a particularly reactive Ser residue. Examples of serine proteases include trypsin, tryptase, chymotrypsin, elastase, thrombin, plasmin, kallikrein, Complement C1, acrosomal protease, lysosomal protease, cocoonase,  $\alpha$ -lytic protease, protease A, protease B, serine carboxypeptidase II, subtilisin, urokinase, Factor VIIa, Factor IXa, and Factor Xa. The serine proteases have been investigated extensively over a period of several decades and the therapeutic value of inhibitors of serine proteases is well understood.

Serine protease inhibitors play a central role in the regulation of a wide variety of physiological process including coagulation, fibrinolysis, fertilization, development, malignancy, neuromuscular patterning and inflammation. It is well known that these compounds inhibit a variety of circulating proteases as well as proteases that are activated or released in tissue. It is also becoming clear that serine protease inhibitors inhibit critical

-2-

cellular processes, such as adhesion, migration, free radical production and apoptosis. In addition, animal experiments indicate that intravenously administered serine protease inhibitors, variants or cells expressing serine protease inhibitors, provide a protective effect against tissue damage.

Serine protease inhibitors have also been predicted to have potential beneficial uses in the treatment of disease in a wide variety of clinical areas such as oncology, neurology, haematology, pulmonary medicine, immunology, inflammation and infectious disease.

In particular serine protease inhibitors may be beneficial in the treatment of thrombotic diseases, asthma, emphysema, cirrhosis, arthritis, carcinoma, melanoma, restenosis, atheroma, trauma, shock and reperfusion injury.

Asthma, the most prevalent of all mast cell mediated conditions affects about 5% of the population in industrialised countries and there is evidence that its incidence and severity are on the increase. Furthermore, the incidence of childhood asthma is rising and there are suggestions of a link between environmental pollutants and the onset of the disease.

Initially, it was believed that bronchoconstriction, i.e. the narrowing of the airways in the lungs, was the major feature of asthma. However, it is now recognised that inflammation in the lungs is an integral part of the development of the disease.

The inhalation of an allergen by an asthmatic generates a strong immune system response which triggers release of various inflammatory mediators, including histamine and

-3-

leukotrienes from inflammatory cells. These increase the permeability of the blood vessel walls, attract inflammatory cells into the tissues and contract the smooth muscle around the airways. As a result, fluid leaks from the blood and  
5 the tissues swell, further narrowing the airways. The inflammatory cells cause damage to the epithelial cells lining the airways exposing nerve endings which stimulates secretion of mucous as well as augmenting the inflammation by causing the release of neurokinins.

10 Thus asthma is a complex disease frequently characterised by progressive developments of hyper-responsiveness of the trachea and bronchi as a result of chronic inflammation reactions which irritate the epithelium lining the airway and cause pathological thickening of the  
15 underlying tissues.

Leukocytes and mast cells are present in the epithelium and smooth muscle tissue of the bronchi where they are activated initially by binding of specific inhaled antigens to IgE receptors. Activated mast cells release a number of  
20 preformed or primary chemical mediators of the inflammatory response in asthma as well as enzymes. Moreover, secondary mediators of inflammation are generated by enzymatic reactions of activated mast cells and a number of large molecules are released by degranulation of mast cells.

25 It has therefore been proposed that chemical release from mast cells probably accounts for the early bronchiolar constriction response that occurs in susceptible individuals after exposure to airborne allergens. The early asthmatic reaction is maximal at around 15 minutes after allergen  
30 exposure, recovery occurring over the ensuing 1 to 2 hours.

-4-

In approximately 30% of individuals, the early asthmatic reaction is followed by a further decline in respiratory function which normally begins within a few hours and is maximal between 6 and 12 hours after exposure. This late  
5 asthmatic reaction is accompanied by a marked increase in the number of inflammatory cells infiltrating bronchiolar smooth muscle and epithelial tissues, and spilling into the airways. These cells are attracted to the site by release of mast cell derived chemotactic agents.

10 The most straightforward way of dealing with an asthma attack is with a bronchodilator drug which causes airways to expand. The most effective bronchodilators are the  $\beta$ -adrenergic agonists which mimic the actions of adrenalin. These are widely used and are simply administered to the  
15 lungs by inhalers. However, bronchoconstrictor drugs are primarily of use in short term symptomatic relief, and do not prevent asthma attacks nor deterioration of lung function over the long term.

Anti-inflammatory drugs such as cromoglycate and the  
20 corticosteroids are also widely used in asthma therapy. Cromoglycate has anti-inflammatory activity and has been found to be extremely safe. Although such cromolyns have minimal side effects and are currently preferred for initial preventive therapy in children, it is well known that they  
25 are of limited efficacy.

The use of corticosteroids in asthma therapy was a major advance since they are very effective anti-inflammatory agents, however, steroids are very powerful, broad spectrum anti-inflammatory agents and their potency  
30 and non-specificity means that they are seriously limited by

-5-

adverse side effects. Localising steroid treatment to the lungs using inhaler technology has reduced side effects but the reduced systemic exposure following inhalation still results in some undesirable effects. Hence, there is a  
5 reluctance to use steroids early in the course of the disease.

There therefore still remains a need for an alternative asthma therapy which is a safe, effective, anti-inflammatory or immunomodulatory agent which can be taken to treat  
10 chronic asthma.

Tryptase is the major secretory protease of human mast cells and is proposed to be involved in neuropeptide processing and tissue inflammation. Tryptase is one of a large number of serine protease enzymes which play a central  
15 role in the regulation of a wide variety of physiological processes including coagulation, fibrinolysis, fertilization, development, malignancy, neuromuscular patterning and inflammation. Although a large number of serine proteases have been widely investigated, tryptase  
20 still remains relatively unexplored.

Mature human tryptase is a glycosylated, heparin-associated tetramer of catalytically active subunits. Its amino-acid structure appears to have no close counterpart among the other serine proteases which have been  
25 characterised. Tryptase is stored in mast cell secretory granules and after mast cell activation, human tryptase can be measured readily in a variety of biological fluids. For example, after anaphylaxis, tryptase appears in the blood stream where it is readily detectable for several hours.  
30 Tryptase also appears in samples of nasal and lung lavage

-6-

fluid from atopic subjects challenged with specific antigen. Tryptase has been implicated in a variety of biological processes where activation and degranulation of mast cells occur. Accordingly, mast cell tryptase inhibition may be of great value in the prophylaxis and treatment of a variety of mast cell mediated conditions. Mast cells can degranulate by both IgE-dependent and independent mechanisms thereby implicating tryptase in both atopic and non-atopic inflammatory conditions. Tryptase can activate proteases such as pro-urokinase and pro-MMP3 (pro-matrix metalloprotease 3, pro-stromelysin), thereby indicating a pathological role in tissue inflammation and remodelling. Furthermore, the recent evidence that tryptase can activate certain G-protein coupled receptors (eg PAR2) and induce neurogenic inflammation points to a broader physiological role, for example in modulating pain mechanisms. Given tryptase's multiple mechanisms of action, it has been proposed that tryptase inhibitors may be beneficial in a broad range of diseases. These include conditions such as: asthma (specifically influencing the inflammatory component, the underlying hyperreactivity, and the chronic fibrotic damage due to smooth muscle thickening); chronic obstructive pulmonary disease (COPD) and pulmonary fibrotic diseases; rhinitis; psoriasis; urticaria; dermatitis; arthritis; Crohn's disease; colitis; angiogenesis; atherosclerosis; multiple sclerosis; interstitial cystitis; migraine headache; neurogenic inflammation and pain mechanisms; wound healing; cirrhosis of the liver; Kimura's disease; pre-eclampsia; bleeding problems associated with menstruation and the menopause; cancer (particularly melanoma and tumour

-7-

metastasis); pancreatitis; and certain viral infections (Yong, Exp. Toxic Pathol, 1997, 49, 409; Steinhoff et al., Nat. Med., 2000, 6, 151; Downing and Miyan, Immunol. Today, 2000, 21, 281; Tetlow and Wooley, Ann. Rheum. Dis., 1995, 54, 549; Jeziorska, Salamonsen and Wooley, Biol. Reprod., 1995, 53, 312; Brain, Nat. Med., 2000, 6, 134; Olness et al., Headache, 1999, 39, 101.) The underlying principle is that a tryptase inhibitor should have utility where mast cells have being induced to degranulate by whatever  
5 mechanism, including anaphylactic reactions due to exogenous substances, e.g. morphine-induced bronchoconstriction (Bowman and Rand, 2<sup>nd</sup> ed., 1980.)  
10

In WO96/09297, WO95/32945, WO94/20527 and US 5,525,623 a variety of peptide based compounds are suggested as  
15 potential inhibitors of the mast cell protease tryptase. In WO95/03333 a tryptase inhibitor is provided by a polypeptide obtainable from the leech *Hirudo medicinalis*. In WO96/08275 secretory leukocyte protease inhibitor (SLPI) and active fragments thereof have been found to inhibit the proteolytic  
20 activity of tryptase. In WO99/55661 certain 4-aminomethylbenzoic ester derivatives are proposed as potential tryptase inhibitors.

We have now found that certain aromatic compounds carrying lipophilic side chains are particularly effective  
25 as inhibitors of the serine protease, tryptase.

It is envisaged that the compounds of the invention will be useful not only in the treatment and prophylaxis of asthma but also of other allergic and inflammatory conditions mediated by tryptase such as allergic rhinitis,  
30 skin conditions such as eczema, psoriasis, atopic dermatitis

-8-

and urticaria, rheumatoid arthritis, conjunctivitis, inflammatory bowel disease, neurogenic inflammation, atherosclerosis and cancer.

Thus viewed from one aspect the invention provides a

15 Compounds of formula I have surprisingly been found to be particularly effective as inhibitors of tryptase and to show a surprising selectivity for tryptase over other serine proteases.

In the compounds of the invention, where the alpha atom  
20 is carbon it preferably has the conformation that would result from construction from a D- $\alpha$ -aminoacid NH<sub>2</sub>-CR<sub>1b</sub>(Cy)-COOH where the NH<sub>2</sub> represents part of X-X. Likewise the fourth substituent R<sub>1b</sub> at an alpha carbon is preferably a methyl or hydroxymethyl group or hydrogen.

Examples of particular values for L are CO, CONH, CH<sub>2</sub>NHCO and CONHCH<sub>2</sub>, more preferably CO or CONH.

It will be appreciated by those skilled in the art that a diverse range of organic groups are lipophilic, and that it is therefore impractical to define with precision each and every structure that may be incorporated into a serine protease inhibitor according to the invention. Accordingly, it is being assumed that the addressee of this specification will not require an exhaustive computer listing of structures of lipophilic groups, but will instead make use of the structures of lipophilic groups disclosed in the specification, especially those exemplified; the test systems described herein for identifying serine protease inhibitors; and common general knowledge of the lipophilicity, synthesis and stability of organic compounds, to obtain novel serine protease inhibitor compounds of formula (I).

The lipophilic group may be, for example, an alkyl, alkenyl, carbocyclic or heterocyclic group, or a combination of two or more such groups linked by a spiro linkage or a single or double bond or by C=O, O, S, SO, SO<sub>2</sub>, CONR<sub>1e</sub>, NR<sub>1e</sub>-CO-, NR<sub>1e</sub> linkage (where R<sub>1e</sub> is as defined for R<sub>1a</sub>), optionally substituted by one or more oxo or R<sub>3</sub> groups in which R<sub>3</sub> is alkylaminocarbonyl, alkoxycarbonylamino, N-alkylaminoalkanoyl, N-alkanoylaminoalkanonyl, C-hydroxyaminoalkanoyl or is as defined for R<sub>3a</sub>.

When the lipophilic group comprises an alkyl group, this may be, for example, a (1-3C) alkyl group, such as methyl, ethyl or propyl. Preferably an alkyl group is unsubstituted.

When the lipophilic group comprises a carbocyclic group, this may be, for example, a non-aromatic or aromatic, mono or polycyclic hydrocarbon group containing up to 25, more preferably up to 10 carbon atoms. The carbocyclic group  
5 may thus be, for example, a cycloalkyl, polycycloalkyl, phenyl or naphthyl group, or a cycloalkyl group fused with a phenyl group.

Examples of particular values for a cycloalkyl group are (3-6C) cycloalkyl groups, such as cyclopentyl and  
10 cyclohexyl. A cycloalkyl group is preferably unsubstituted or substituted by one group  $R_3$ , preferably an amino or alkyl group.

15 bicycloalkyl, for example decalinyl, norbornyl or adamantyl. A polycycloalkyl group is preferably unsubstituted or substituted by one, two or three  $R_3$  groups, for example alkyl such as methyl. An example of a polycycloalkyl group substituted by alkyl is isopinocampheyl.

20 A phenyl group is preferably unsubstituted or substituted by one or two  $R_3$  groups.

A naphthyl group is preferably unsubstituted or substituted by one  $R_3$  group.

Examples of a cycloalkyl or cycloalkenyl group fused  
25 with a phenyl group are indanyl and tetrahydronaphthyl. This group is preferably unsubstituted or substituted by oxo or one or two  $R_3$  groups. Examples of groups substituted by oxo are 1-oxoindan-5-yl, 1-oxo-5,6,7,8-tetrahydronaphth-5-yl and 1-oxo-5,6,7,8-tetrahydro-naphth-6-yl.

30 When the lipophilic group comprises a heterocyclic

-13-

group, this may be, for example, a non-aromatic or aromatic, mono or polycyclic group containing one or two oxygen, nitrogen or sulfur atoms in the ring system, and in total up to 25, more preferably up to 10 ring system atoms.

5        Examples of a heterocyclic group when it is a non-aromatic monocyclic group are azacycloalkyl groups, such as pyrrolidinyl and piperidinyl; azacycloalkenyl groups, such as pyrrolinyl; diazacycloalkyl groups, such as piperazinyl; oxacycloalkyl groups, such as tetrahydropyranyl; and  
10    thiacycloalkyl groups, such as tetrahydrothiopyranyl. A non-aromatic monocyclic group preferably contains 5, 6 or 7 ring atoms and is preferably unsubstituted or substituted by one group  $R_1$ .

      Examples of a heterocyclic group when it is a non-  
15    aromatic polycyclic group are bicyclic groups, such as azacycloalkyl fused with phenyl, for example dihydroindolyl, dihydroisoindolyl, tetrahydroquinolinyl and tetrahydroisoquinolinyl; and azacycloalkyl fused with cycloalkyl, such as decahydroisoquinolinyl.

Another group of compounds of particular interest is  
that in which L represents CONH and Lp represents

-21-

Another particular group of compounds of formula I is that in which L represents CONH and L<sub>p</sub> represents

in which R<sub>3x</sub> represents R<sub>3</sub> or a group of formula

-22-

It will be appreciated that when  $L_p$  represents a group as described above, it corresponds to a group in which  $L_p$  is a combination of a heterocyclic group (2,3-dihydroindolyl), a carbocyclic or heterocyclic group ( $R_j$ ) and optionally an alkyl group ( $G_1$ ), which groups are linked by a single bond or a carbonyl group. Accordingly, examples of particular values for  $R_j$  are the examples given above for a carbocyclic or heterocyclic group forming part of  $L_p$ . Particular mention may be made of pyrrolidinyl, such as pyrrolidin-1-yl, phenyl, thiazolyl, such as thiazol-4-yl, imidazolyl, such as imidazol-4-yl, and pyridyl, such as pyrid-2-yl, pyrid-3-yl and pyrid-4-yl.

Examples of values for  $G$  are  $-\text{CH}_2-$ , and  $\text{CH}_2\text{CH}_2$ .

The 2,3-dihydroindolyl group in the above formula is preferably a 2,3-dihydroindol-5-yl or -6-yl group, especially a 2,3-dihydroindol-6-yl group.

Examples of structures of compounds comprising a 2,3-dihydroindolyl group as described above are:

-23-

aminoacetyl;

Cy is preferably unsubstituted or substituted by one or two  $R_{3a}$  groups.

Preferably  $R_{3a}$  is hydrogen, hydroxyl, amino, aminomethyl, hydroxymethyl, amido, formylamino, acetylamino or aminoacetyl.

Examples of particular values for Cy are cyclohexyl, piperidin-4-yl, phenyl, 4-aminophenyl, 4-hydroxyphenyl, 3-aminomethylphenyl, 4-aminomethylphenyl, 4-hydroxymethylphenyl, 3-hydroxymethylphenyl, 2-hydroxymethylphenyl, 4-phenylphenyl, 2-aminothiazol-4-yl, 2-formylaminothiazol-4-yl, 2-aminothiazol-5-yl, 2-formylaminothiazol-5-yl, 4-aminopyrid-3-yl, 3-amino-pyrid-4-yl and naphth-1-yl.

Referring to the group  $R_1$ , the group  $R_1$  is preferably a group of formula  $-CH(R_{6a})NH_2$  in which  $R_{6a}$  is hydrogen or methyl. Most preferably it is aminomethyl.

Preferably  $R_2$  represents a 5 or 6 membered aromatic carbon ring optionally interrupted by a nitrogen, oxygen or sulphur ring atom, substituted in the 3 position by  $R_1$ .

The 5 or 6 membered aromatic ring is preferably unsubstituted or substituted in the position alpha to the X-X.. group (i.e. 6 position for a six membered aromatic ring etc) by amino, hydroxy, halo, alkyl, carboxy, cyano, amido, aminoalkyl, alkoxy or alkylthio. More preferably it is unsubstituted or substituted by amino. Most preferably it is unsubstituted.

$R_2$  is preferably a group of formula

-28-

wherein  $R_5$  is amino, hydroxy, aminomethyl, hydroxymethyl or hydrogen, and  $R_6$  and  $R_7$  which may be the same or different represent hydrogen or  $R_1$ .

- 5  $R_5$  is preferably amino or hydrogen. Most preferably it is hydrogen.

Preferably,  $R_2$  is a group of formula

- in which  $R_5$  is amino, hydroxy, aminomethyl, hydroxymethyl or  
10 hydrogen, and  $R_{6a}$  is hydrogen or methyl.

Most preferably,  $R_2$  is 3-aminomethylphenyl.

A group of compounds of particular interest is that of formula

-29-

in which:

$L-Lp(D)_n$  represents  $CO-L_x$ ;

$R_s$  represents amino, hydroxy, aminomethyl, hydroxymethyl or hydrogen;

5  $R_{6a}$  represents hydrogen or methyl;

$Cy$  is a saturated or unsaturated, mono or poly cyclic, homo or heterocyclic group, preferably containing 5 to 10 ring atoms and optionally substituted by groups  $R_{3a}$  or phenyl optionally substituted by  $R_{3a}$ ;

10 each  $R_{3a}$  independently is  $R_{1c}$ , amino, halo, cyano, nitro, thiol, alkylthio, alkylsulphonyl, alkylsulphenyl, hydrazido, alkylsulphonamido, alkylamino-sulphonyl, aminosulphonyl, haloalkoxy, and haloalkyl;

each  $R_{1c}$  independently represents hydrogen or hydroxyl, 15 alkoxy, alkyl, aminoalkyl, hydroxyalkyl alkoxyalkyl, alkoxycarbonyl, acyloxymethoxycarbonyl or alkylamino optionally substituted by hydroxy, alkylamino, alkoxy, oxo, aryl or cycloalkyl;

$L_x$  is a mono or bicyclic group bound to the carbonyl 20 via a pendent nitrogen atom or nitrogen atom which forms part of the mono or bicyclic ring;

or a physiologically tolerable salt thereof, e.g. a halide, phosphate or sulphate salt or a salt with ammonium or an organic amine such as ethylamine or meglumine.

25 It will be appreciated that when  $L_x$  is bound to the carbonyl via a pendant nitrogen, the group  $CO-L_x$  corresponds with the group  $L-Lp(D)_n$  in which  $L$  is  $CONH$  and  $Lp$  is a mono or bicyclic group. When  $L_x$  is bound to the carbonyl via a nitrogen that forms part of the mono or bicyclic ring, the 30 group  $CO-L_x$  corresponds with the group  $L-Lp(D)_n$  in which  $L$

-30-

is CO and Lp is a mono or bicyclic group containing a nitrogen atom in the ring and bound to L via this nitrogen.

It is believed that an aminomethyl group positioned on the 3 position of the phenyl ring will give rise to  
 5 excellent binding within the S1 binding pocket of tryptase.

Without wishing to be limited by theory it is believed that the presence of a hydrogen bond donating group attached to the phenyl group will be essential for successful inhibition of tryptase.

10  $R_5$  and  $R_6$  are both preferably hydrogen.

Most preferably the Lx group comprises

15

A and B are independently chosen from NH, N, O, S, CH, CH<sub>2</sub>;

-31-

$X_{1x}$  and  $X_{2x}$  are independently chosen from  
 $(CH_2)_m$ ,  $(CH_2)_mCH=CH(CH_2)_p$ ,  $CO(CH_2)_m$ ,  $NH(CH_2)_m$ ,  $NHCO(CH_2)_m$ ,  
 $CONH(CH_2)_m$ ,  $SO_2NH(CH_2)_m$ ,  $NHSO_2(CH_2)_m$ ;

$n$  is 1 or 2;

5  $m$  is 0 to 2;

$p$  is 0 to 2;

$R_{1x}$  and  $R_{2x}$  are independently chosen from hydrogen,  
 alkoxy, alkyl, aminoalkyl, hydroxyalkyl, alkoxyalkyl,  
 alkoxycarbonyl, amino, halo, cyano, nitro, thiol, alkylthio,  
 10 alkylsulphonyl, alkylsulphenyl, oxo, heterocyclo optionally  
 substituted by  $R_{3x}$ , cycloalkyl optionally substituted by  $R_{3x}$   
 or aryl optionally substituted by  $R_{3x}$ ; and

$R_{3x}$  is hydrogen, alkoxy, alkyl, amino, hydroxy, alkoxy,  
 alkoxycarbonyl, halo, cyano, nitro, thiol, sulphonyl, or  
 15 sulphenyl.

Examples of heterocyclic  $R_{1x}$  and  $R_{2x}$  groups are  
 piperidine, piperazine and pyrrolidine.

The cyclic group attached to the alpha atom is  
 preferably an optionally  $R_{3a}$  substituted phenyl.

20 Thus, one group compounds of the invention are those of  
 formula (II)

II

25

wherein  $Lx$  is as hereinbefore defined. It is envisaged that

-32-

especially preferred Lx groups will be those in which a cyclic or bicyclic ring is substituted by hydrogen bond donating and/or acceptor groups.

In another embodiment of the invention it is envisaged that the phenyl-based functionality on the left side of the compounds of the invention may be replaced by an optionally substituted, e.g. R substituted, 2-aminomethylthiophene.

The compounds of the invention may be prepared by conventional chemical synthetic routes, e.g. by amide bond formation to couple the aromatic function to the alpha atom and to couple the lipophilic function to the alpha atom. Where the alpha atom is a carbon, the cyclic group-alpha atom combination may conveniently derive from an alpha amino acid (preferably of D configuration) with the aromatic deriving from for example an acid derivative of a compound based on R<sub>2</sub>, e.g. an aminomethylbenzoic acid (which is readily available). Amide formation from such reagents (in which any amino or hydroxyl function (especially in an aminomethyl group) may if desired be protected during some or all of the synthesis steps) yields a compound of formula (V).

(where Cy and R<sub>2</sub> are as defined above).

Prior to reaction the amino group in an aminoalkyl group should be protected by an appropriate protecting group e.g. Boc, Z, Fmoc or Bpoc. The use of protecting groups is described in McOmie, "Protective Groups in Organic Chemistry", Plenum, 1973 and Greene, "Protective Groups in Organic Synthesis", Wiley Interscience, 1981.

According to another aspect therefore, the present

-33-

invention provides compounds of formula (I')

in which R<sub>2</sub>, is as defined for R<sub>2</sub> except that the aminoalkyl  
 5 group R<sub>1</sub> is replaced by a protected aminoalkyl group of  
 formula PG-NH(alkyl)- in which PG is an amino protecting  
 group (defined in more detail below).

The lipophilic group (and optionally simultaneously the  
 hydrogen bond donor) may then conveniently be introduced by  
 10 reaction of a compound of formula (V) (or another analogous  
 carboxylic acid) optionally after transformation into an  
 activated form, e.g. an acid chloride or active ester, with  
 a lipophilic group carrying an amine, hydroxylamine,  
 hydrazine or hydroxyl group, e.g. to produce compounds with  
 15 linkages of -CO-NR<sub>1</sub>-, -CO-NR<sub>1d</sub>-O-, -CO-NR<sub>1d</sub>-NR<sub>1d</sub>- and -CO-O-  
 from the alpha atom (where it is a carbon) to the lipophilic  
 group. If necessary the amide linkage can be reduced using  
 an appropriate reducing agent employing the necessary  
 protection depending on whether concurrent reduction of the  
 20 carboxylic acid moiety is also desired. Alternatively a  
 compound of formula V or another analogous carboxylic acid  
 may be transformed into an alcohol by reaction with  
 isobutylchloroformate and reduction with sodium borohydride.

Such an alcohol, e.g. of formula (VI)

can be reacted to introduce the lipophilic group by  
 reactions such as:

alkylation with an alkyl halide in the presence of a

base;

reaction under Mitsunobu conditions, such as with diethyl azodicarboxylate/triphenylphosphine and a hydroxylated aryl compound;

5 by reaction with an activated carboxylic acid (e.g. an acid chloride) or with a carboxylic acid and diethylazodicarboxylate/triphenylphosphine;

by reaction with an isocyanate; and

by treatment with methanesulphonyl chloride or  
10 trifluoromethanesulphonic anhydride and reaction with an amine, or with a thiol optionally followed by oxidation, e.g. with potassium metaperiodate or hydrogen peroxide.

In this way compounds with linkages of  $-\text{CH}_2-\text{O}-$ ,  
 $-\text{CH}_2-\text{O}-\text{CO}-$ ,  $-\text{CH}_2-\text{O}-\text{CO}-\text{NR}_{1d}-$ ,  $-\text{CH}_2-\text{NR}_{1d}-$ ,  $-\text{CH}_2-\text{S}-$ ,  $-\text{CH}_2-\text{SO}-$  and  
15  $-\text{CH}_2-\text{SO}_2-$  between the alpha carbon and the lipophilic group may be produced.

Alternatively the alcohol can be oxidized to form a corresponding aldehyde (e.g. by oxidation with manganese dioxide or DMSO/oxalyl chloride or DMSO/ $\text{SO}_3$  or Dess-Martin  
20 reagent) which may be reacted to introduce the lipophilic group by reactions such as:

reaction with Wittig reagents or Horner-Emmons reagents, optionally followed by reduction of the resulting carbon:carbon double bond using  $\text{H}_2/\text{Pd}$ -carbon;

25 reaction with an organometallic, eg a Grignard reagent, optionally followed by reaction on the resulting hydroxyl group, such as oxidation (eg with  $\text{MnO}_2$ , DMSO/oxalyl chloride or Dess-Martin reagent), alkylation (eg with an alkyl halide in the presence of a base in a solvent such as DMF),  
30 arylation (eg with diethylazo dicarboxylate/triphenyl

-35-

phosphine and a hydroxyaryl compound), ester formation (eg with an acid chloride or with a carboxylic acid and diethylazido dicarboxylate/triphenyl phosphine), or carbamate formation (eg with an isocyanate);

5 by reaction with an amine followed by reduction, e.g. with sodium cyanoborohydride;

by reaction with a hydrazine; or

by reaction with a carbazide.

In this way compounds with linkages of  $-\text{CH}=\text{CR}_{1d}-$ ,  
 10  $-\text{CH}_2-\text{CHR}_{1d}-$ ,  $-\text{CHOH}-$ ,  $-\text{CHR}_{1d}-\text{O}-$ ,  $-\text{CHR}_{1d}-\text{O}-\text{CO}-$ ,  $-\text{CHR}_{1d}-\text{O}-\text{CO}-\text{NR}_{1d}-$ ,  
 $-\text{CO}-$ ,  $-\text{CH}_2-\text{NR}_{1d}-$ ,  $-\text{CH}=\text{N}-\text{NR}_{1d}-$  and  $-\text{CH}=\text{N}-\text{NR}_1-\text{CO}-\text{NR}_{1d}-$  between  
 the alpha carbon and the lipophilic group may be produced.

The transformation of alcohol to amine referred to  
 above may be used to produce an amine reagent for lipophilic  
 15 group introduction, e.g. a compound

Such an amine reagent may be reacted to introduce the lipophilic group, e.g. by acylation with an acid halide or activated ester, by reaction with isocyanate, by reaction  
 20 with an isothiocyanate, or by reaction with a sulphonyl chloride. In this way compounds with linkages of  $-\text{CH}_2\text{NR}_{1d}-$   
 $\text{CO}-$ ,  $-\text{CH}_2-\text{NR}_{1d}-\text{CO}-\text{NR}_{1d}-$ ,  $-\text{CH}_2\text{NR}_{1d}-\text{CS}-\text{NR}_{1d}-$  and  $-\text{CH}_2\text{NR}_{1d}-\text{SO}_2-$   
 between the alpha carbon and the lipophilic groups may be produced.

25 The transformation of acid to amide referred to above may be used to produce an amide reagent for introduction of the lipophilic group, e.g. a compound

Such amides may be reacted to introduce lipophilic  
 30 groups, e.g. by reaction with a haloketone (e.g. phenacyl

-36-

bromide). This provides a linkage

from alpha carbon to lipophilic group.

Analogously the amide may be transformed to a thioamide  
5 by reaction with Lawesson's reagent and then reacted with a  
haloketone to form a linkage

The amide reagent may likewise be transformed to a nitrile  
reagent by dehydration, e.g. with trifluoroacetic anhydride.

10 The nitrile reagent may be reacted with hydrazine then with  
acyl halide and then cyclized, (e.g. with trifluoroacetic  
anhydride) to produce a linkage

Alternatively it may be treated with hydroxylamine then  
15 reacted with acyl halide and cyclized (e.g. with  
trifluoroacetic anhydride) to produce a linkage

The hydrazide produced by reaction of a carboxylic acid  
reagent with hydrazine discussed above may likewise be used  
20 as a reagent for lipophilic group introduction, e.g. as a

-37-

compound of formula

Thus the hydrazide reagent can be reacted with an acyl  
halide and cyclized, e.g. with trifluoroacetic anhydride to  
5 yield a linkage

or reacted with an acyl halide or an isocyanate to yield  
linkages  $-\text{CO}-\text{NR}_1-\text{NR}_{1d}-\text{CO}-$  and  $-\text{CO}-\text{NR}_{1d}-\text{NR}_{1d}-\text{CO}-\text{NR}_{1d}-$   
respectively.

10 Alternatively the hydrazide may be transformed by  
reaction with Lawesson's reagent and then reacted with an  
acyl halide and cyclized (e.g. with trifluoroacetic  
anhydride) to produce the linkage

15 An alternative route to these compounds is to carry out  
any of the above chemical reactions to incorporate the  
lipophilic group (an optional H bond donor) into a protected  
intermediate such as a compound of formula (VII).

20

PG = Protecting group

The protecting group may then be removed before  
coupling of the for example o-amino benzoic acid (optionally  
protected).

-38-

The protection of amino and carboxylic acid groups is described in McOmie, Protecting Groups in Organic Chemistry, Plenum Press, NY, 1973, and Greene and Wuts, Protecting Groups in Organic Synthesis, 2nd. Ed., John Wiley & Sons, NY, 1991. Examples of carboxy protecting groups include C<sub>1</sub>-C<sub>6</sub> alkyl groups such as methyl, ethyl, t-butyl and t-amyl; aryl(C<sub>1</sub>-C<sub>4</sub>)alkyl groups such as benzyl, 4-nitrobenzyl, 4-methoxybenzyl, 3,4-dimethoxybenzyl, 2,4-dimethoxybenzyl, 2,4,6-trimethoxybenzyl, 2,4,6-trimethylbenzyl, benzhydryl and trityl; silyl groups such as trimethylsilyl and t-butyl dimethylsilyl; and allyl groups such as allyl and 1-(trimethylsilylmethyl)prop-1-en-3-yl.

Examples of amine protecting groups (PG) include acyl groups, such as groups of formula RCO in which R represents C<sub>1-6</sub> alkyl, C<sub>3-10</sub> cycloalkyl, phenyl C<sub>1-6</sub> alkyl, phenyl, C<sub>1-6</sub> alkoxy, phenyl C<sub>1-6</sub> alkoxy, or a C<sub>3-10</sub> cycloalkoxy, wherein a phenyl group may be optionally substituted, for example by one or two of halogen, C<sub>1</sub>-C<sub>4</sub> alkyl and C<sub>1</sub>-C<sub>4</sub> alkoxy. Preferred amino protecting groups include t-butoxycarbonyl (Boc) and benzyl.

$\alpha$ -Amino acids of formula (VII) which are not commercially available can be synthesized by methods known in the art, for example as described in "Synthesis of Optically Active  $\alpha$ -Amino Acids" by Robert M. Williams (Pergamon Press, 1989) and "Asymmetric Synthesis of ArylGlycines", Chem. Rev. 1992, 889-917.

Compounds of the type (VII) made be prepared (for example) by one or more of the following methods.

(i) from aryl or heteroaryl aldehydes via the Strecker synthesis or modifications thereof, via Bucherer-Bergs

-39-

hydantoin synthesis, or via the Ugi methodology (Isonitrile Chemistry, Ugi I. Ed.; Academic: New York, 1971; pp145-199) with removal and replacement of protecting groups;

(ii) from styrenes via Sharpless methodology (J. Am. Chem. Soc. 1998, 120, 1207-1217)

(iii) from aryl boronic acids via Petasis methodology (Tetrahedron, 1997, 53, 16463-16470) with removal and replacement of protecting groups;

(iv) from aryl and heteroaryl acetic acids - via Evan's azidation (Synthesis, 1997, 536-540) or by oximation, followed by reduction and addition of protecting groups;

(v) from existing aryl glycines by manipulation of functional groups, for example, alkylation of hydroxy groups, palladium assisted carbonylation of triflates derived from hydroxy groups and further manipulation of the carboxylic esters to give carboxylic acids by hydrolysis, carboxamides by activation of the carboxylic acid and coupling with amines, amines via Curtius reaction on the carboxylic acid; or

(vi) from aliphatic, carbocyclic and non-aromatic heterocyclic aldehydes and ketones using a Horner-Emmons reaction with N-benzyloxycarbonyl)- $\alpha$ -phosphonoglycine trimethyl ester (Synthesis, 1992, 487-490).

Examples of synthetic schemes are shown below:

-41-

### Synthesis of protected 4-piperidylglycine

### Synthesis of protected 2-aminothiaz-4-ylglycine

A starting reagent for lipophilic group introduction where the alpha atom is nitrogen may be produced for example by reaction of a beta protected hydrazine (such protection to be chosen as to be compatible with the subsequent reagents to be employed) with phosgene, diphosgene,

5

-42-

triphosgene or N,N'carbonyl

diimidazole to give a reactive compound of the type:

PG = Protecting group

- 5 This intermediate may be used as has been described above for the carboxylic starting reagents where the alpha atom is carbon.

Removal of the protecting group by standard methods and coupling with an activated aryl carboxylic acid will give

- 10 compounds of the type

(where  $\text{R}_2$ , X, Y, Cy, L, Lp and D are as defined above).

- 15 Thus viewed from a further aspect the invention provides a process for the preparation of a compound according to the invention which process comprises coupling a lipophilic group to a compound of formula (VIII)

(wherein  $\text{R}_2$ , X, Y and Cy are as defined above and  $\text{Z}_1$  is a reactive functional group), and optionally subsequently coupling a hydrogen bond donor group to said lipophilic

25 group.

Instead of introducing the group  $\text{L}-\text{Lp}(\text{D})_n$  as the final stage process step, the compounds of formula I may

-43-

alternatively be prepared by a process in which the group  $R_2$  is introduced in the final process step.

Thus viewed from another aspect the invention provides a process for the preparation of a compound according to the invention which process comprises coupling a lipophilic group to a compound of formula (IX)

(wherein Y, Cy, L, Lp D, and n are as defined above and  $Z_2$  is HX or a reactive functional group), or a protected derivative thereof, with a compound of formula (X)

(wherein  $R_2$  is as defined above and  $Z_3$  is XH or an appropriate reactive group), or a protected derivative thereof, followed if necessary by the removal of any protecting groups.

Thus, for a compound of formula I in which X-X represents CONH, a compound of formula (IX) in which  $Z_2$  is  $H_2N$  may be reacted with a compounds of formula (X) in which  $Z_3$  is COOH or a reactive derivative thereof, such as a acyl halide or an anhydride, for example as described in the Examples herein.

Where the lipophilic group Lp comprises more than one group, it may generally be formed by coupling these groups together at an appropriate stage in the preparation of the compound of formula I using conventional methods or as described in the Examples.

The compounds of the invention may be administered by any convenient route, e.g. into the gastrointestinal tract (e.g. rectally or orally), the nose, lungs, musculature or

-44-

vasculature or transdermally. The compounds may be administered in any convenient administrative form, e.g. tablets, powders, capsules, solutions, dispersions, suspensions, syrups, sprays, suppositories, gels, emulsions, patches etc. Such compositions may contain components conventional in pharmaceutical preparations, e.g. diluents, carriers, pH modifiers, sweeteners, bulking agents, and further active agents. Preferably the compositions will be sterile and in a solution or suspension form suitable for injection or infusion. Such compositions form a further aspect of the invention.

The following are examples of pharmaceutical compositions of compounds according to the invention.

The sodium carboxymethyl starch, magnesium stearate, and talc, previously passed through a No. 60 mesh U.S. sieve, are then added to the granules which, after mixing, are compressed on

-46-

a tablet machine to yield tablets each weighing 150 mg.

In particular, it is believed that the compounds of the invention will have excellent oral bioavailability.

30 **Experimental:**

Abbreviations used follow IUPAC-IUB nomenclature. Additional abbreviations are HPLC, high-performance liquid chromatography; LC/MS, liquid chromatography / mass spectrometry; rt, retention time; NMR, nuclear magnetic resonance, TBTU, 2-(1H-(benzotriazol-1-yl)-1,1,3,3-tetramethyluroniumtetrafluoroborate. Starting materials were purchased from Aldrich (Gillingham, UK), Lancaster (Morecambe, UK), Avocado (Heysham, UK), Maybridge (Tintagel, UK), Nova Biochem (Nottingham, UK) or Bachem.

**Purification:**

Flash column chromatography was carried out using Merck silica gel Si60 (40-63  $\mu$ m, 230-400 mesh). Purification of final products was by crystallisation, flash column chromatography or gradient reverse phase HPLC on a Waters Deltaprep 4000 at a flow rate of 50 mL/minute using a Deltapak C18 radial compression column (40 mm x 210 mm, 10-15 mm particle size). Eluant A consisted of aqueous trifluoroacetic acid (0.1 %) and eluant B 90% acetonitrile in aqueous trifluoroacetic acid (0.1 %) with gradient elution (Gradient, 0 minutes 5 % B for 1 minutes, then 5 % B to 20 % B over 4 minutes, then 20 % B to 60 % B over 32 minutes). Fractions were analysed by analytical HPLC and LC/MS before pooling those with >95 % purity for lyophilisation.

**Analysis:**

Proton nuclear magnetic resonance ( $^1\text{H}$  NMR) spectra were recorded on a Bruker DPX300 (300 MHz). Analytical HPLC's

-48-

were performed on a Shimadzu LC6 gradient system equipped with an autosampler. Eluant A consisted of aqueous trifluoroacetic acid (0.1 %) and eluant B consisted of 90 % acetonitrile and 10 % water, containing trifluoroacetic acid (0.1 %). Gradient 1 elution began at 5 % B and increased to 100 % B over seven minutes. Gradient 2 elution began at 5 % B and increased to 100 % B over ten minutes. Gradient 3 elution began at 5 % B for one minute, increasing to 20 % B after the fourth minute, 40 % B after the 14<sup>th</sup> minute and then 100 % B after the 15<sup>th</sup> minute. The columns used were Luna 2 C18 (3  $\mu$ , 30 mm x 4.6 mm), Luna 2 C18 (5  $\mu$ , 150 mm x 2 mm) and a Symmetry Rp8 (3.5  $\mu$ , 50 x 2.1 mm).

LC/MS were performed on a PESCIEX single quadrupole API-150EX instrument, equipped with a Luna 2 C18 column (3  $\mu$ , 30 mm x 4.6 mm) eluting with 20 % to 100 % acetonitrile in water over five minutes.

Prepared from (*R/S*)-8-methyl-5,6,7,8-tetrahydronaphth-2-ylamine, synthesised as described below.

10

(*R/S*)-8-methyl-5,6,7,8-tetrahydronaphth-2-ylamine

A suspension of methyltriphenylphosphonium iodide (680 mg, 1.68 mmol) in tetrahydrofuran (7 mL) was cooled to  $-45^\circ\text{C}$ . *n*-Butyllithium (1.0 mL, 1.6 M in hexane, 1.60 mmol) was then  
15 added dropwise, and the solution was stirred for 1 hour.  
1,2,3,4-Tetrahydro-7-nitro-1-oxonaphthalene (200 mg, 1.05 mmol) in tetrahydrofuran (3 mL) was then added over 5 minutes. The reaction mixture was allowed to warm to room temperature before being quenched with water (20 mL). The  
20 solution was then extracted with dichloromethane (2 x 25 mL), the solvent was dried ( $\text{MgSO}_4$ ) and concentrated under reduced pressure to give a black oil. The crude product was then purified by flash chromatography (ethyl acetate / hexane; 1:40) to afford 5,6,7,8-tetrahydro-8-methylene-2-  
25 nitro-naphthalene as a white solid (150 mg, 76%).

A solution of the olefin (100 mg, 0.53 mmol) in methanol (2 mL) was stirred over 10% palladium on carbon (20 mg). The mixture was purged with hydrogen and stirred for 18 hrs under a balloon of hydrogen. The reaction mixture was then  
30 filtered through celite, washing with additional methanol,

and concentrated under reduced pressure to afford (R/S)-8-methyl-5,6,7,8-tetrahydronaphth-2-ylamine as a colourless oil (75 mg, 82%).

dimethylformamide (20 mL) was added and the mixture allowed to stir overnight. The dimethylformamide was evaporated under reduced pressure and the resulting oil partitioned between water (50 mL) and ethyl acetate (50 mL). The ethyl acetate was washed with 5% aqueous HCl (10 mL) and saturated aqueous NaHCO<sub>3</sub> (10 mL), dried (MgSO<sub>4</sub>) and evaporated under reduced pressure to give the amide as a golden foam (1.6 g, 97 %).

Trifluoroacetic acid (5 mL) was added to a solution of the above foam in dichloromethane (20 mL) and the solution was allowed to stir for 2 hours at room temperature. The solvent was evaporated under reduced pressure to give the amine trifluoroacetate salt as a red foam (1.5 g, 91 %) which was used without further purification.

-69-

3.0 mmol) in dimethylformamide (5 mL) was added. The mixture was stirred overnight before the dimethylformamide was evaporated under reduced pressure, and the resulting oil partitioned between water (50 mL) and ethyl acetate (50 mL).

5 The ethyl acetate layer was washed with 5% aqueous HCl (10 mL) and saturated aqueous NaHCO<sub>3</sub> (10 mL), dried (MgSO<sub>4</sub>) and evaporated under reduced pressure to give a yellow solid.

A solution of the above solid in methanol (50 mL) was stirred over 10%Pd/C (500 mg) under an atmosphere of H<sub>2</sub> and heated under reflux for 2 hours. The mixture was cooled, filtered and the solvent evaporated under reduced pressure to provide the unprotected dihydroindole as a yellow foam (1.4g, 88%) which was used without further purification.

25 A solution of the dihydroindole (500 mg, 1.0 mmol) and triethylamine (0.28 mL, 2 mmol) in dichloromethane (20 mL) was stirred at 0°C and acetyl chloride (86 mg, 1.1 mmol) was added dropwise, then left to stir overnight. The mixture was washed with 5% aqueous HCl (10 mL) and the organic phase was dried (MgSO<sub>4</sub>) and evaporated. The residue was purified by

flash column chromatography (ethyl acetate / hexane, 1:1) to give a yellow oil. The oil was dissolved in dichloromethane (20 mL) and treated with trifluoroacetic acid (5 mL). After stirring for 2 hours the solvent was evaporated under reduced pressure to an oil, which after triturating with diethyl ether gave the amine as its trifluoroacetate salt as a white solid (337 mg, 61 %).

**D-(4-Hydroxyphenyl)glycine methyl ester hydrochloride**

D-4-Hydroxyphenylglycine (12.5 g, 74.8 mmol) and dry  
methanol (24 mL) were stirred in a dry 250 mL three necked  
round bottom flask, equipped with a low temperature  
25 thermometer. The mixture was stirred under nitrogen and  
cooled to an internal temperature of below -20°C. Using a  
syringe, thionyl chloride (6 mL, 9.78 g, 82.2 mmol) was  
added dropwise to the cooled mixture over a period of 10  
minutes at such a rate that the internal temperature did not  
30 exceed -20°C. Once the addition was complete the mixture

-93-

was allowed to warm to room temperature and stirred overnight. Dry ether (150 mL) was added and the white precipitate that formed was collected by suction filtration, washed with a little more ether and dried (15.5g, 95%).

***N*-BOC-D-(4-Hydroxyphenyl)glycine methyl ester**

Di-*t*-butyl dicarbonate (15.9 g, 72.8 mmol) was added to a stirred mixture of D-4-hydroxyphenylglycine methyl ester hydrochloride (14 g, 64.3 mmol) and NaHCO<sub>3</sub> (11.7 g, 0.14 mol) in tetrahydrofuran (150 mL) and water (50 mL), in one portion. The mixture was stirred rapidly for 4h. Hexane (75 mL) was added and the organic layer separated and washed with saturated aqueous NaHCO<sub>3</sub> (20 mL) and brine (20 mL) and dried (MgSO<sub>4</sub>). Evaporation of the solvent afforded the *N*-BOC-protected amine (19.7g, 96%).

***N*-BOC-D-(4-Trifluoromethylsulphonyloxyphenyl)glycine methyl ester**

2,6-Lutidine (9.44 mL, 8.68 g, 81.0 mmol) and 4-dimethylaminopyridine (1.65 g, 13.5 mmol) were added to a stirred solution of *N*-BOC-D-(4-hydroxyphenyl)glycine methyl ester (19 g, 67.5 mmol) in dichloromethane (400 mL) and the mixture cooled in an ice bath. Trifluoromethanesulphonic anhydride (13.7 mL, 23.0 g, 81.4 mmol) was added over a period of five minutes and then the mixture was allowed to warm to room temperature over four hours. The solution was washed with water (2 x 150 mL), 1N HCl (2 x 150 mL) and saturated aqueous NaHCO<sub>3</sub> (150 mL) and dried (MgSO<sub>4</sub>). Evaporation of the solvent afforded an oil which was purified by flash chromatography on silica gel (hexane /

dichloromethane 1:1 and then neat dichloromethane)  
affording the triflate as a white solid (19 g, 77%).

**N-BOC-D-(4-benzyloxycarbonylphenyl)glycine methyl ester**

5 N-BOC-D-(4-trifluoromethylsulphonyloxyphenyl)glycine methyl ester (27.6 g, 77.0 mmol), benzyl alcohol (32.6 mL, 34.1 g, 315 mmol), palladium (II) acetate (255 mg, 1.13 mmol), bis-1,3-diphenylphosphinylpropane (448 mg, 1.09 mmol) and triethylamine (10.2 mL, 7.40 g, 73.2 mmol) in  
10 dimethylformamide (72 mL) were placed in a Parr reactor and the reactor assembled. The vessel was pressurised to ~10 psi with nitrogen and the gas released (repeated five times to remove all oxygen from the system). Carbon monoxide gas was then carefully introduced to ~20 psi and released three  
15 times. Carbon monoxide was then added to ~100 psi and the stirrer started. The vessel was slowly heated to 65 °C internal temperature and then stirred, monitoring by tlc. When complete (after ~ 18 hours) the reaction was cooled to 30°C, the gas released and the vessel flushed five times  
20 with nitrogen as before. The reaction mixture was partitioned between ethyl acetate (250 mL) and water (100 mL) and the organic layer washed with 1M hydrochloric acid (30 mL) and saturated aqueous NaHCO<sub>3</sub> (30 mL) and dried (MgSO<sub>4</sub>) and evaporated. Purification of the resulting oil by

Examples 72 and 73

The compounds of Examples 72 and 73 were prepared by the method described below, but using the appropriate starting materials.

Boc D-phenylglycine (251 mg, 1 mmol.) was dissolved in dimethylformamide (3ml) with HATU [O-(7-azabenzotriazol-1-yl)-1,1,3,3-tetramethyluronium hexafluorophosphate] (380
